India's Journey towards Becoming a Developed Nation by 2047

Dr. Kailashpati

Assistant Professor, Department of Management, School of Management Sciences Lucknow, Lucknow

Abstract :- India's vision of becoming a developed nation though sounds hard to accomplish, the country is marching in this direction to make it happen by 2047. While finalizing this vision document, the NITI Aayog will shortly test its main concepts and objectives on leading industry experts such as Tim Cook of Apple, Ajay Banga of the World Bank, and Indian industrialists and thought leaders in order to make any necessary adjustments and account for any gaps. The initiative might be seen as the government's campaign promise for potential voters before of the Lok Sabha election. The goal of the Vision India@2047 project, launched by India's top policy think tank, NITI Aayog, is to produce a roadmap for the country's growth over the next 25 years. India is to become a global leader in innovation and technology, a role model for social welfare and human development, and an advocate for environmental sustainability as a result of this project. reaching a GDP of USD 30 trillion, with a per capita income of between USD 18 and USD 20, sound state finances, and a thriving financial sector. removing needless government intervention in citizens' lives and advancing digital governance and the economy. Fostering local industry and innovation, merging or reorganizing, and producing three to four global champions in each field. strengthening India's position in the world and achieving self-reliance in the space and defense industries boosting the capability of renewable energy sources and cutting carbon emissions to promote green growth and climate action. providing education and skills to young people in order to increase employment chances. collaborating with international R&D companies to construct the nation's top ten laboratories and bringing at least constructing top-notch facilities and infrastructure in both rural and urban locations.

Keywords :- social welfare, innovation, technology, environmental sustainability, financial sector, digital governance, renewable energy, carbon emission, climate action, education skill, employment chances, infrastructure, good governance, manufacturing export, sectoral contribution, MSME, green economy, tourism, Amrit kaal, Fastag, financial inclusion, skill development, self employment, innovation research and development, global initiative.

Introduction :- In 2021 Independence Day speech, the Hon'ble Prime Minister paid respect to the freedom fighters and shared his vision for Amrit Kaal and 2047, when the nation would celebrate 100 years of independence. The objective of 'Amrit Kaal' is to make an India where differences between the village and the city is diminished and where the government does not interfere unnecessarily within the lives of citizens.

Objective of developed India is to come out of the colonial mindset, take pride in our roots, and a sense of obligation among citizens. He encouraged the citizens to sustain modern conceivable outcomes, realize new resolutions and move ahead with certainty. He too underlined collective endeavours and cooperation is required to take the nation forward.

Definition of a Developed Nation :- A developed country, or high-income country, is a sovereign state with an excellent quality of life, rich economy and advanced technological infrastructure compared to other less industrialized countries. The GDP (Gross Domestic Product), GNP (Gross National Product), per capita income, level of industrialisation, amount of widespread infrastructure and general standard of living are commonly used to assess economic development.

According to the International Monetary Fund, 41 countries and territories are officially

listed as "Advanced economies". An example of a criterion that might be used is income per capita; developed countries are those that have high GDP per capita.

Industrialization is another economic indicator; developed nations are those in which the tertiary and quaternary sectors of industry predominate.

The Human Development Index (HDI), a different metric that combines life expectancy and education indices with national income, an economic indicator, has gained prominence in recent years. Developed nations would be those with a very high (HDI) rating according to this criterion.

India's Aspirations and Goals :- Many projections and reports show that India could become the world's third biggest economy as early as 2030 and have a GDP exceeding that of the US by 2060. India is an economic power house with sustained economic growth numbers and quintupling per capita income since 2000.

However, in order to achieve its aspirations for the future, India must make the shift from a predominantly rural, informal economy to a hub of modern manufacturing and technology driven service-based economy. This would enable India to gain momentum on the global trend towards sustainability and increased technological advancement with sustained growth.

The dream can come true if India can figure out how to use more of its people's creative energies and make the most of its youth by giving them the opportunities and resources they need to drive the change.

India has the potential to become a global leader in inclusive and sustainable economic growth if it successfully manages its challenges. Success for India is in the best interests of the entire globe.

Importance of Achieving Developed Status :- For the country and its people, being a developed nation is a major accomplishment.

Better Quality of Life : Higher living standards for citizens are generally associated with a country's development. The ability to obtain improved housing, infrastructure, healthcare, education, and other necessities of life raises standard of living overall.

Economic Prosperity : Stronger and more diverse economies in developed countries are often associated with higher levels of prosperity and economic stability.

Enhanced Global Standing : They can negotiate favourable trade agreements, influence foreign policy, and play a more assertive role in international affairs because they have greater diplomatic, economic, and geopolitical clout.

Technological Advancement : Scientific and technological developments not only spur economic expansion but also result in improvements in healthcare, communication, infrastructure, education, technology, space and other sectors.

Social Development and Inclusion : Social cohesion and harmony are enhanced by policies targeted at lowering poverty, inequality, discrimination, and social exclusion.

Environmental Sustainability : To mitigate environmental deterioration and climate change, developed countries often invest in renewable energy, conservation efforts, pollution control measures and sustainable development initiatives.

Better Governance and Rule of Law : Political stability and public trust are fostered by the maintenance of the rule of law, accountability, transparency, and respect for human rights.

Enhanced Crisis Resilience : Social safety nets, diverse economies, and stronger institutions all work to lessen the negative effects of crises on the wellbeing of the populace.

Current State of India's Development :-

Economic Growth and GDP Trends :- In ten years, the nation has advanced significantly from the fragile five to the first five, establishing itself as a major player in the world economy.

In just ten years, India oversaw a number of significant events, including the rise of populism in the West in 2016, the demonetization of currency in 2017, the shadow banking crisis in 2018, a pandemic that struck once in a lifetime in 2020, the biggest inflation in 40 years in the West (which is still ongoing), and two wars since the beginning of 2022. India continued to build its ship while sailing ahead despite the uncertainty.

It is anticipated that the world economy would expand by 2.7% in 2024 and 1.7% in 2023. Forecasts for 2023 have been revised down for 95% of advanced economies and over 70% of emerging market and developing nations, indicating a widespread predicted steep decline in growth.

Growth Rates and Projections :- The US Federal Reserve's policy rates are currently around 4.5%, and the price of oil is currently about US\$85 per barrel. India's foreign exchange reserves have nearly doubled to US\$568 billion, while the country's CAD has shrunk to 1.9% of GDP in fiscal 2023 (and is predicted to decline even more in the upcoming fiscal).

India's gross domestic product (GDP) is expected to grow at a rate higher than 7.2% in FY24, despite the world economy struggling with growth rates that hardly rise over 3%. For the third year running, the Indian economy has grown by more than 7% this year. The Indian economy has grown steadily over the past ten years, with growth in the non-food credit market, the banking sector, and public sector investment all contributing to this trend. India is now the third-largest fintech economy globally, after the United States and the United Kingdom. In addition, it has overtaken Hong Kong to take the fourth position in the world's stock exchanges. This accomplishment is a result of consistent IPO activity and interest from both domestic and foreign investors.

The government is taking action to keep reducing the fiscal deficit, with the goal of getting it below 4.5% by 2025–2026. Following that trajectory, the projected fiscal deficit for 2024–2025 is 5.1% of GDP. It is predicted that during 2024–25, gross and net market borrowings through dated securities will total ~14.13 and 11.75 lakh crore, respectively. Each will be lower than what it is in 2023–2024. Since private investments are now being made on a significant scale, the Central Government's reduced borrowing will allow for more financing to be made available to the private sector.

Sectoral Contributions :- Momentum will be strong when the world starts to recover later in 2024, and India's economy will grow significantly more broadly as that global recovery tide lifts all boats.

Increased financial inclusion (via novel digital payment methods like the unified payments interface [UPI]), formal credit formalisation (through account aggregator networks), and revenue leak plugging (through online tax platforms and FASTag) are just a few of the outcomes of technology-led know-how solutions. Increased tax income and the closing of tax loopholes have helped close the fiscal deficit and provided the government with additional funds for capital expenditures. The number of domestic retail investors in the capital market has increased, which has increased the amount of money available for alternative funding sources. Additionally, more capital is being formed through bonds and stocks.

The Centre's robust direct tax and GST revenues demonstrate the corporate sector's steady recovery. Together, the states' deficits and net market borrowings have marginally declined. The agricultural sector has been the main driver of GDP growth overall.

Manufacturing and Exports :- The concurrent focus on creating specialised and sophisticated industrial sectors and constructing the necessary physical infrastructure has been India's second

economic engine. At the moment, manufacturing makes up only 15% of the GDP. The government has concentrated on industries that can take use of India's comparative advantage in resources and talents, seize chances in the local market, and propel the nation up the global manufacturing value chain. With the goal of increasing manufacturing, improving logistics to save costs and conserve resources, and reaping the benefits of positive externalities, the Production Linked Incentive (PLI) scheme, PM Gati Shakti, tax incentives, the ease of implementing business reforms, the national infrastructure programme, and the national logistics plan were announced.

India will undoubtedly gain a great deal from the relocation of manufacturing from a densely populated region of the world to other areas. India aims to reduce its logistics expenditures from 14% to 8%, or six percentage points, during the next five years. Production-linked incentives are an important way to boost exports of manufactured goods.

An concentration on exporting that is strong is the third catalyst. India has broadened its export portfolio and shifted to higher value-added products during the past ten years as policymakers realised that the country needed to develop commodities that were both cost-competitive and high-quality while also growing product complexity in order to compete with the rest of the globe. As a result, traditional baskets' percentage of total exports decreased, while that of engineering, medicinal, and electronics items climbed. More significantly, non-IT services exports are also increasing, and together they are gradually offsetting the merchandise imbalance by 25%.

Social Development Indicators :-

1. Education
2. Healthcare
3. Gender Equality
4. Infrastructure Development
5. Transportation
6. Energy
7. Communication

Challenges Hindering India's Path to Development :- India has a number of obstacles to overcome before it can be considered a developed nation. India's economy has grown significantly, but the country still faces severe poverty and socioeconomic inequality. India faces a challenge in producing adequate job opportunities to absorb the labour force due to its fast expanding population.

The natural resources and ecosystems are under tremendous strain due to the rapid urbanisation, population increase, and industrialization, endangering ecological sustainability, public health, and climatic resilience. India's healthcare system still confronts many obstacles despite advancements in the field, such as poor infrastructure, a lack of medical experts, unequal access to services, and enduring health inequities. In addition to marginalising vulnerable populations, discrimination and social exclusion impede their access to social services, healthcare, work opportunities, and education, which feeds the cycle of poverty and inequality.

The latest CMIE research indicates that unemployment has gone up in the last month. In February 2024, it was discovered that the unemployment rate in India was 7.45%. High rates of underemployment and unemployment are a result of a mismatch between labour market demands and job abilities, especially for young people and those living in rural areas.

MSME Sector :- With the majority of manufacturers experiencing a lack of competitiveness due to high logistical costs, increasing inflation, insufficient production and operational scale, subpar ecosystems and collaborative networks, an inability to link investment and know-how, bad branding, and low productivity. The expansion and economic contributions of micro, small, and medium-sized businesses—which are essential to the manufacturing ecosystem's success—have also been impeded by these problems.

There is still a challenge facing Micro,

Small, and Medium-Sized Enterprises (MSME) enterprises. This illustrates how, during the industrial recovery, smaller and larger enterprises performed considerably differently. Since a large percentage of the labour force is employed by MSMEs, their continuous financial strain is a sign of the health of the labour market and has a cascading effect on the recovery.

Global Uncertainty :- The need for this sector to grow in India is becoming more widely acknowledged. It will create jobs for low- and semi-skilled workers (as well as absorb "disguised unemployed" workforces from the agricultural sector) and lessen reliance on critical goods and geographic areas.

Following the major international trade war and the COVID-19 pandemic, global supply chains have remained flexible, and multinational companies are searching for alternative investment destinations to diversify their supply chains. In the face of fierce competition, India has a limited amount of time before supply chains freeze once more. Global protectionism will rise, as will support for de-globalization and economic fragmentation.

Energy Constraint :- India must address the demand for cleaner and alternative energy sources even as it keeps its industrial sector front and centre. The nation's industry's reliance on fossil fuels exposes it to geopolitical unrest and, as a result, to the volatility of these supply chains and pricing, which reduces its competitiveness. In addition, countries that place limitations on imports and their alternatives according to their carbon intensity will exert pressure. India's dependency on imported energy, which accounts for 4% of its GDP, is problematic for the balance of payments of the nation.

Steps Towards Achieving Developed Status :- To achieve this transitional, milestone India has to develop a technology-driven and knowledge-based economy with strong public finances, and a robust

financial sector. For this Government highlights the importance "Jan Bhagidari through Sabka Saath Sabka Prayas" (Equal participation of all the strata and class of society) is essential. This would lead to a prosperous and inclusive India, in which the fruits of development reach all regions and citizens, especially our youth, women, farmers, OBCs, Scheduled Castes and Scheduled Tribes.

Government Policies and Initiatives :- In the budget of year 2023-24 Government highlighted that the economic agenda for achieving this vision would focus on three priorities -facilitating ample opportunities for citizens, especially the youth, to fulfil their aspirations, providing strong impetus to growth and job creation and strengthening macro-economic stability.

Government set seven priorities that complement each other and act as the 'Saptarishi' which will guide for the fulfilment of the vision of 'Amrit Kal'-

- Inclusive Development
- Reaching the Last Mile
- Infrastructure and Investment
- Unleashing the Potential
- Green Growth
- Youth Power
- Financial Sector

The government intends to adopt reforms for the next generation and work with the states and interested stakeholders to arrive at a consensus for their effective implementation.

Economic Reforms :- Micro, Small, and Medium-Sized Enterprises (MSME) require timely and sufficient funding, pertinent technologies, and suitable training in order to expand and compete on a global scale. Creating a regulatory framework that will support their expansion will be a key component of this policy mix. The government must encourage high-rate, more resource-efficient economic growth that is sustained. In terms of accessibility, cost, and availability, this will contribute to energy security. The financial sector needs to be prepared by the government in terms

of size, capacity, skills, and regulatory framework in order to meet the investment needs.

Societal changes and Inclusive growth :- The difficulties brought on by rapid population expansion and demographic shifts require thoughtful consideration. We eventually need a system in place to deal with these issues in a thorough manner in regard to "Viksit Bharat."

The government is dedicated to providing an environment that will enable individuals to fulfil their dreams and to strengthening and growing the economy with rapid growth. To have a multifaceted contribution to overall progress, all states, stakeholders, and social groups must be considered collectively.

For instance, the states must implement numerous growth- and development-enabling reforms in order to realise the goal of "Viksit Bharat."

This year, a fifty-year interest-free loan of seventy-five thousand crore rupees is offered to promote such milestone-linked reforms by the state governments.

Aspirational district program and micro focus on North eastern states backs the commitment of an inclusive growth.

Development of women and youth :- Since women and those under 30 make up over 70% of India's population, they have enormous potential to contribute significantly to the country's economy if given the chance to reach their full potential.

India is expected to have the world's highest working-age population by 2030. Millions of additional workers entering the labour field might result in a massive "demographic dividend" for India's economy if these individuals are successful in finding employment.

Another possible driver of future economic growth is women. Less than 20% of Indian women are employed outside the home at the moment. According to the International Monetary Fund, granting women's employment parity with men would result in India having more

workers than the EU does for either gender, making the country at least 27% wealthier.

The government is striving to remedy this by, for example, repealing restrictions that prohibit women from working, but the road won't be straight given that female labour force participation in India has been declining.

Government launched many schemes like 'Lakhpati Didi'. With empowerment and self-reliance, 83 lakh SHGs including 9 crore women are changing the socioeconomic landscape of rural areas. Their accomplishments have already helped approximately one crore women achieve Lakhpati Didi status. They serve as an example for others. Their accomplishments will be honoured in order to acknowledge them. Encouraged by the outcome, the goal for Lakhpati Didi has been increased from 2 crore to 3 crore.

Green Economy :- The government's emphasis on initiatives for green growth, which lower the economy's carbon intensity and create a lot of green jobs. Numerous initiatives for green fuel, green energy, green farming, green mobility, green buildings, green equipment, and green buildings must be put into action. Policies for the efficient use of energy across different economic sectors must also be implemented.

By encouraging the development of manufacturing and charging infrastructure, the government is strengthening and extending the e-vehicle ecosystem. Through payment security mechanisms, e-bus use for public transportation networks is being pushed.

It is necessary to take these steps in order to reach the pledge to achieve "net-zero" by 2070. For sustainable economic growth, biomanufacturing and bio foundry policies must be formulated effectively, and the blue economy must be developed.

Building skills harnessing technology :- As part of its New Education Policy, the Indian government is attempting to upskill working-age citizens nationally in order to better prepare them for jobs in the twenty-first century. The Policy stresses

modular and lifelong learning to assist people update their abilities in a rapidly changing workplace, moves away from rote learning towards flexible, creative thinking, and offers a robust vocational education curriculum to help people develop the skills needed for the modern economy.

The PM-Vishwakarma Yojna is a new programme designed for traditional craftsmen and artisans. Taking note of the fact that their artwork and handicrafts embodies the authentic essence of Aatmanirbhar Bharat, a package of support has been prepared for them for the first time.

They will be able to integrate their products with the MSME value chain and enhance the quality, reach, and scale of their offerings thanks to the new programme. In addition to financial assistance, it will provide access to refined skill development programmes, education on cutting-edge digital methods and effective green technologies, brand promotion, connections to domestic and international markets, digital payments, and social security.

Harnessing Technology :- In the upcoming years, technology will be integral to the development of any nation. Utilising cutting edge technology and empowering the populace with digital resources and expertise can speed up the economy's development engine.

India is a global leader in digital payments, handling nearly twice as many digital payments in the country as Visa does worldwide.[5] It is astounding to learn that 99% of Indians, including those living in rural areas, have biometric identity enabled. India is embracing new technology with gusto, launching the country's first digital rupee trial in December 2022. India's economy might expand if the digital rupee improves the country's financial system's accessibility, security, and effectiveness.

This kind of ambition could make India a more formidable player in the tech space in the years to come, the most of its youthful, tech-savvy populace, quickly growing internet access, upcoming nationwide 5G rollout, and among-the-

cheapest data pricing globally.

Tourism Development :- The accomplishment of holding the G20 summit in sixty locations showcased India's diversity to an international audience. Because of our robust economy, the nation is a desirable travel location for conferences and business travellers. Today's middle class also wants to travel and experience new things. There is a tonne of chances for local entrepreneurship in the tourism industry, especially spiritual tourism.

States should be pushed to develop famous tourist destinations thoroughly, branding them, and promoting them internationally. There will be a system in place for classifying the centres according to the calibre of their amenities and offerings.

Initiatives for port connectivity, tourism infrastructure, and amenities must be pursued in order to meet the growing demand for domestic travel. This will also contribute to the creation of jobs.

Infrastructure Development :- India is constructing the necessary infrastructure to back a contemporary, networked, service-driven economy. India's endeavour to accomplish a number of development objectives, including as creating the technology and infrastructure essential for maintaining a thriving, modern economy. The construction of roads and airports, along with other economy-boosting initiatives, is receiving enormous funding from public-private partnerships, which has contributed to the doubling of India's national highway kilometres since 2014.

The capital expenditure outlay for the upcoming year is being increased by 11.1% to eleven lakh, eleven thousand, one hundred and eleven crore rupees (11,11,111 crore), building on the massive tripling of the outlay in the previous four years, which resulted in a huge multiplier impact on economic growth and employment creation. This amounts to 3.4% of the GDP. India's

development towards becoming a worldwide hub for manufacturing and exports is being accelerated by the government's provision of production-linked incentives (PLI) to encourage manufacturing and bolster small and medium-sized enterprises. India is now one of the largest exporters of smartphones worldwide as a result of these incentives, which have proved very appealing to makers of electronics and mobile phones. India is in a good position to draw businesses looking to expand their international supply chains, which will promote the expansion of India's industrial sector.

Private Sector Participation and Investments :- A golden period was marked by the USD 596 billion in FDI the inflow between 2014 and 2023. More robust and transformative wide spectrum private partnerships in the market is required to give a boost to different sectors of the society and provide an edge for development in different sectors. In the spirit of "first develop India," more bilateral investment treaties should be negotiated with international partners in order to promote sustained foreign investment.

Conclusion :- "There is no shortage of opportunities; as many opportunities as we want." The nation has the capacity to produce additional opportunities. The sky is the limit.

In October 2022, Ms. Kristalina Georgieva, MD, IMF, at the IMF/WB Annual Meetings: India's economy has continued to grow rapidly despite these challenging times, earning it the title of bright spot on an otherwise bleak horizon. Above all, however, this expansion is supported by structural changes, chief among which is India's amazing achievement in digitization—from digital identity to offering all services and assistance based on digital access. As per the Professional Views and Evaluations Article IV of the IMF for India (2018): The country's economy has benefited from the implementation of an inflation-targeting monetary policy framework, the Goods and Services Tax (GST), the Insolvency and Bankruptcy

Code (IBC), and the liberalization of foreign investment inflow. The economy is now more accessible to international investors thanks to the reforms. The fact that the framework for managing capital flow was becoming more permissive, particularly with regard to foreign direct investment, was welcomed by the directors. Directors praised the significant advancements made in fortifying the economy's supply side as a result of significant infrastructure spending. Secondly, Expectations and Perceptions by the Public

And Remarks and Obstacles to the Development Story including Opportunities and Challenges for the Future. Apart from all these India's status as a developed country by 2047 above all Potential challenges and uncertainties is not unattainable. Well-designed **Strategies** for Overcoming Challenges and Accelerating Development through Innovation and Technology Will Shape the Future undergoing examination of Recent Advancements, Assessing the Prospects of Achieving Developed Status by 2047, Emphasizing the Need for Inclusive and Sustainable Development, Proposals for Formulating and Implementing Policies, Final Thoughts and a Call to Action is ultimately needed to accomplish the target .
